Warning from the website warnung.bund.de

Official federal warning website for water contamination

Whether cyber attacks against state institutions, flood information, weather warnings, warnings of strong odor or smoke development, or warnings about drinking water contamination, etc. At the address: https://warnung.bund.de/meldungen of the Federal Office for Civil Protection and Disaster Assistance, journalists lacking ideas among chaos merchants can always find a report if need be, from which a sensational headline can be constructed. However, every private individual can also inform themselves neutrally and above all almost in real time. We point out this website because we are interested in warnings about contaminated tap water.

Currently, there are warnings about contaminated drinking water in four large areas throughout the federal territory. In Sindelfingen, only 40 kilometers away from the truu water filter manufactory, the first warning was already issued 6 days ago and was expanded this afternoon to the district of Maichingen and the municipality of Magstadt. Heavy rainfall, a pipe break, or a drinking water accident prompt the water authorities in such a case to counteract contamination from bacteria with the help of chlorine. Because chlorine can be harmful to the health of infants, small children, and immunocompromised persons, the authorities specifically warn these target groups on their website against consumption. For the production and treatment of food, chlorinated water should furthermore be boiled for at least 10 min, it is stated. Because chlorine is also not good for the normal adult. German water authorities therefore prefer to refrain from adding chlorine. To ensure freedom from germs, however, they are permitted according to the drinking water regulation to add up to 0.3 milligrams of free chlorine per liter to drinking water. If one considers that a bacterial contamination must first be detected before chlorine is added next, and until we then first read in the newspaper or hear on the radio that our tap water is contaminated, several days can already pass. Only those who have a reliable water filter system are protected against this

form of contamination and are permanently protected.
