Prof. Dr. med. Alfred Pischinger (1899-1983), Viennese histologist and embryologist, recognized a basic regulation in the living organism. It unfolds in the space between cells, blood vessels, lymphatic pathways and nerve endings. Cell-available water is therefore a prerequisite for optimal biological performance. Prof. Pischinger says: "Human performance is decided in the space between cells, in the connective tissue. All toxic substances that humans come into contact with through breathing, skin and food spread between the cells. If they settle there because their removal does not function, the body's performance is reduced. All substances that do not belong in the body and accumulate there are toxic to that body, even if they are not considered poisons outside of it." Cell-available, hexagonal, pure water (i.e., as mineral-free as possible) ensures the REMOVAL of these waste substances from the cell! https://t.me/truuinfochannel You can find more of his interesting theses at:
