Prof. Ingo Froböse is a university professor for prevention and rehabilitation in sports at the German Sport University Cologne. He directs the Centre for Health through Sport and Movement as well as the Institute for Movement Therapy and Movement-Oriented Prevention and Rehabilitation. Additionally, he is the scientific director of the Institute for Quality Assurance in Prevention and Rehabilitation GmbH (IQPR GmbH).

In 2012, the television broadcaster FOX produced a report explaining why mineral water cannot fulfill its function in the body and can neither absorb nutrients from food nor transport harmful substances out of cells. Prof. Froböse states in his interview: "We need water that is almost pure and contains hardly any minerals. The mineral water industry has built a wonderful business out of this because they claim that there are indeed many minerals that can be carried into cells with mineral water (...). We believe we need water that has a high absorption capacity, meaning it is almost pure, contains hardly any minerals, and has hardly any suspended solids, because only then can it guarantee that it can quickly and efficiently take on its transport function." further information at: https://t.me/truuinfochannel

It's good.
to be truu.
