Dr. Emoto was the first to provide photographic proof that water molecules apparently respond to words. Only at the end of his life did he realize that he had to revise all his works, because water molecules do not respond to the written word as he initially thought, but rather to the reader of the word. Words such as "love" or admiration change water completely differently than words (thought or spoken) that express negative emotions, such as anger or hatred. This is also the reason why Emoto's simple "rice test" works and reveals to every person - regardless of their belief or intelligence - their emotional, mental power.

The biophysicist and researcher Dr. Ulrich Warnke (73) provides well-founded explanations through his measurements and imaging procedures for the phenomenon that emotions and the mere intention of people can change particles and matter, indeed even create them. Warnke was, among other things, head of the Biomedical Technology Department at Saarland University. He is the author of the book "How Our Will Controls Health and Well-being" and other books.

Warnke observes with the help of quantum physics a clear "hierarchy of the mind". He speaks of a "goal-oriented information recognition and processing, that is, an intelligence". According to Warnke, a Swiss study shows that, for example, trust in the doctor is far more important than the medicines or devices he uses. Medicine refers here to the placebo effect, that is, the effect of a "dummy medication" without an active ingredient. Prof. Warnke is therefore convinced that the future of medicine lies in the use and optimization of this effect. Is he thus falling into the do-gooder trap?

Part IV, Short Interview with Prof. Warnke

It's good.
to be truu.
