This so-called scientific community, on the one hand, vehemently denies the power of consciousness and attempts to degrade established scientists to "anti-scientists" the moment they speak of this form of power. In doing so, water provides a simple indicator for this phenomenon. It sounds positively paradoxical that this same "scientific community" must regularly and thoroughly engage with this placebo effect.

Placebos, that is "dummy medications" without active ingredients, dominate medicine so strongly that they cannot be ignored. According to Dr. Ulrike Bingel, pain researcher at the University of Hamburg, studies show that even 20 to 90% of participants respond to placebos. Patients experience, for example, pain relief even though the medication contains no active ingredients. The patient's decision makes the difference. - If people are convinced they feel better, then up to 90% of people actually do feel better. Part VI

It's good.
to be truu.
